In modern times, energy storage has become recognized as an essential part of the current energy supply chain. The primary rationales for this include the simple fact that it has the potential to improve grid stability, improve the adoption of renewable energy resources, enhance energy system productivity, reducing the use of fossil fuels, and decrease the ...

In the last 120 years, global temperature has increased by 0.8 °C [1]. The cause has been mainly anthropogenic emissions [2]. If the same trend continues, the temperature increase could be 6.5-8 °C by 2100 [2]. The power sector alone represents around 40% of the energy related emissions [3] and 25% of the total GHG emissions [4] with an average global footprint ...
