We point out that, in most cases, the idle time between two driving cycles can be neglected when the EV runs continuously because the short-term heat dissipation is far less than the heating energy. For example, when T_{bat} is 12.75 °C and T_{env} is -20 °C, a 15-min idle time only leads to about 0.31 °C decrease in T_{bat} . Thus the driving ...
