How does the shunt closing release power supply work in ABB trucks?

In ABB trucks, this function is carried out by the -BGT1 and -BGT2 auxiliary contacts which cut off the release power supply during and before activation of the mechanical lock of the screw truck racking-in device. This means that the shunt closing release power supply can only be applied at the end of activation of the mechanical lock.

A Stored Energy Mechanism (SEM) is a mechanism that opens and closes a device (Switch) by compressing and releasing spring energy. The operating handle compresses a set of closing springs and a separate set of opening springs. These springs store the mechanical energy of this movement and are held in the compressed state by close and open latches.

The advantages of the spring operating mechanism are: the closing and opening currents are not large, and the capacity of the required power supply is not large; It can be used for remote electric energy storage, electric closing and opening, or on-site manual energy storage, manual closing and opening.

In large-scale systems, redundant electric energy in the charging cycle is converted into heat energy by the absorber containing TCES material. Since the heat loss of TCES is relatively small, the electric energy can be directly converted into high-quality heat energy [128, 129]. The advantages of TCES include high energy density, low losses ...
