What is a CAES energy storage system?

CAES is an energy storage system developed from gas turbine technology. Owing to its benefits of a brief construction timeline, low investment requirements, and high efficiency, it has emerged as a focal point of research in energy storage. Conventional CAES is non-adiabatic and depends on additional fossil fuel combustion.

How efficient is adsorption-supercritical/liquid storage system?

The system with adsorption-supercritical/liquid storage method can achieve RTE of 66.68% -89.19%. However, the energy consumption associated with the adsorption/desorption processes of the adsorbent materials will affect the system efficiency.

How adiabatic CO<sub>2</sub> storage system works?

During charge process, CO<sub>2</sub> was compressed to 27.71 MPa and stored in artificial storage tank. During discharge process, the CO<sub>2</sub> expanded to 7.21 MPa. The RTE and exergy efficiency of the system were 59.98% and 52.64%. As shown in Fig.5, Gao et al. designed an adiabatic CCES utilizing abandoned coal mine voids for CO<sub>2</sub> storage.
