## Aging and heat dissipation of energy storage power supply

How does aging affect heat generation?

Over the course of the entire discharge process, the average Qirr for cells 1,2, and 3 stand at 1.23 W,1.33 W, and 1.15 W respectively, indicating that the increase of aging degree will lead to a significant increase in heat generation in each stage of the discharge process.

How does aging affect temperature distribution?

The temperature rise at the edge of cell 2 and cell 1 with more serious aging is higher, while the temperature rise at the center of cell 3 with the smallest aging degree is higher. The temperature distribution at different positions on the surface of the three cells was slightly different.

Does temperature distribution affect aging characteristics of small lithium-ion batteries?

The relationship between temperature distribution and aging characteristics of aging cell was established. Studied the temperature rise characteristics under different cooling conditions of aged cells.

Do thermal management systems reduce thermal runaway after battery aging?

However, there is currently little researchon the cooling effect of thermal management systems after battery aging. We believe that the temperature distribution of aged lithium-ion batteries should be evaluated and a more effective thermal management system should be designed to reduce thermal runaway.

Can thermal management systems keep pace with stationary battery installation development?

Large battery installations such as energy storage systems and uninterruptible power supplies can generate substantial heat in operation, and while this is well understood, the thermal management systems that currently exist have notkept pace with stationary battery installation development.

What is the maximum temperature rise under natural heat dissipation conditions?

However, the maximum temperature rise under natural heat dissipation conditions has the same change trend and the average temperature rise on the surface of three cells at the end of discharge is about 20 °C.
