Can compressed air energy storage be combined with pressurized water thermal energy storage?

This paper presents a hybrid system integrating compressed air energy storage (CAES) with pressurized water thermal energy storage (PWTES). The open type isothermal compressed air energy storage (OI-CAES) device is applied to the CAES subsystem to achieve near-isothermal compression of air.

Can a cogeneration system use pressurized water as a heat storage medium?

A cogeneration system using pressurized water as a heat storage medium is proposed. The open type isothermal compressed air energy storage is applied in the system. The thermodynamic model and the transient mathematical model are developed. The sensitivity of design parameters and thermodynamic parameters are assessed.

What is air cooled seasonal energy storage (ACSES)?

The air-cooled seasonal energy storage (ACSES) system utilizes the natural cold energy of outdoor air during winter to cool the glycol-water solution inside the finned tube cooler. This glycol-water solution is then used to cool the water in the ice-water mixture storage tank through ice storage coils.

What is open type isothermal compressed air energy storage?

The open type isothermal compressed air energy storage is applied in the system. The thermodynamic model and the transient mathematical model are developed. The sensitivity of design parameters and thermodynamic parameters are assessed. The energy efficiency could reach 65.6% with the supply of thermal energy.

What are the different types of compressed air energy storage?

According to the different treatments of the compression heat generated during air compression, the current CAES technology is divided into diabatic compressed air energy storage (D-CAES), adiabatic compressed air energy storage (A-CAES), and isothermal compressed air energy storage (I-CAES), etc , , .

How does a cooling system save energy?

A chilled-water system can save energy by reducing water flow-rates on both the chilled-water and condenser-water sides of the system. This results in significant savings, not only affecting the cooling system but also the electrical system and building construction.
