Do microcapsules improve thermal and mechanical performance of PCMS?

Microcapsules enhance thermal and mechanical performance of PCMs used in thermal energy storage by increasing the heat transfer area and preventing the leakage of melting materials. Nowadays, a large number of studies about PCM microcapsules have been published to elaborate their benefits in energy systems.

What are phase change materials (PCMs)?

Phase change materials (PCMs) are gaining increasing attention and becoming popular in the thermal energy storage field. Microcapsules enhance thermal and mechanical performance of PCMs used in thermal energy storage by increasing the heat transfer area and preventing the leakage of melting materials.

Are PCM microcapsules good for asphalt?

Above all, asphalt mixtures containing reinforced PCM microcapsules have been proved acceptable via dynamic stability tests. The bending beam rheometer test results imply that asphalt mixture containing PCM microcapsules revealed good crack resistance at low temperatures.

Can microencapsulation solve the problem of melt exudation of phase change materials?

The microencapsulation of phase change materials can solve the problem of melt exudation of these materials during the phase change process, improve the environmental adaptability of these materials, and expand their applications. This article mainly reviewed the preparation and application of HTPCM above 300 °C.

Are PCM microcapsules suitable for thermal energy storage?

In this paper, a comprehensive review has been carried out on PCM microcapsules for thermal energy storage. Five aspects have been discussed in this review: classification of PCMs, encapsulation shell materials, microencapsulation techniques, PCM microcapsules' characterizations, and thermal applications.

What are phase change materials?

Phase change materials provide a type of thermal energy storage that can store a large amount of latent heat through physical phase change. This heat is then released in a controlled manner within a small temperature change based on thermal energy requirements.

The greater the incorporation of phase change microcapsules, the more pronounced the temperature-regulating effect. However, the associated costs also increased correspondingly. When the content of phase change microcapsules reached 7 % of the total asphalt mass, the cost increased by approximately 2.1 %/m<sup>3</sup>. This dosage not only achieved ...

Wang et al. [27]. encapsulated refined waste engine oil in microcapsules and incorporated them into asphalt, observing enhancements in viscosity and rheological properties of the asphalt. Additionally, the study revealed that the use of waste engine oil microcapsules prolonged the fatigue life of asphalt, accelerated the recovery of

Phase change materials, also known as latent heat storage materials, store/release large amounts of energy by forming and breaking the chemical bonds between molecules [3, 4].Phase change materials have limited thermal conductivity and suffer from leakage of liquid materials after melting [5] addition, traditional composite phase change materials gradually ...

Poly(ethylene glycol) is one of the most commonly used organic PCMs and has attracted a great deal of

interest in applications for middle/low-temperature heat energy storage and thermal management due to its high latent heat capacity, tunable and preferably located phase-change temperatures, congruently melting performance, good thermal and chemical ...

During the construction and maintenance of asphalt pavement, a lot of non-renewable resources are consumed, which discharge a variety of waste gasses and smoke, causing a serious impact on the environment. Reducing ...

Preparation of phase change materials with higher heat resistance is of great significance for their popularization and application. In this study, based on phase-change microcapsules (micro-PCMs) with epoxy resin as the capsule shell, microcapsules were compounded with different types of epoxy resins to prepare micro-PCMs and epoxy resin ...

Eutectic phase change materials with adjustable phase change temperature, have becoming increasingly attractive in thermal energy storage filed. In this paper, a ternary eutectic phase change material of lauric-myristic-palmitic acid (LMP) was prepared. The thermal properties and non-isothermal crystallization behavior of LMP was analyzed.

Phase change materials (PCMs) can regulate the temperature in asphalt pavement and minimize temperature-related problems, such as rutting and thermal cracking, because of their ability to store ...
