

What is a Power Storage?

A Power Storage is a mid-game building used for buffering electrical energy. It can store up to 100 MWh (or 100 MW for 1 hour). Each Power Storage allows 2 power connections, enabling multiple units to be daisy-chained to store large amounts of energy.

How does energy storage work?

Energy storage systems receive the AGC signal and respond accordingly by either charging (storing excess energy) or discharging (releasing energy into the grid). The rapid response of energy storage helps stabilize the grid within seconds, ensuring that supply consistently meets demand.

How does AGC work with energy storage?

Here's how it typically works in conjunction with energy storage: AGC systems continuously monitor grid conditions, including frequency and voltage levels, as well as the overall balance between supply and demand. When a discrepancy is detected, the AGC system generates a control signal to correct the imbalance.

Why are energy storage systems important?

Energy storage systems are uniquely positioned to respond rapidly to AGC commands, which is essential for several reasons: AGC systems are critical for maintaining the grid's frequency at its nominal value (e.g., 50 Hz or 60 Hz). Energy storage can quickly absorb or discharge energy to correct deviations from the set frequency value.
