Can suspended weight maximize energy storage capacity in abandoned coal mines?

It is currently being trialled in the United Kingdom, targeting abandoned coal mines. The paper presents analysis for sizing the suspended weight to maximize the energy storage capacity, given a mine shaft's physical dimensions.

How do you calculate power in a storage system?

Power is equal to the energy stored as potential energy times the system's efficiency, divided by the time required to lower the weights. For instance, the system will produce more power if the containers are dropped quicker, move from the upper to the lower storage sites.
