When will aluminium be used for energy storage?

Although it is possible that first systems for seasonal energy storage with aluminium may run as early as 2022, a large scale application is more likely from the year 2030 onward.

How much energy can be stored in aluminium?

Energy that is stored chemically in Al may reach 23.5 MWh/m<sup>3</sup>. Power-to-Al can be used for storing solar or other renewable energy in aluminium. Hydrogen and heat can be produced at low temperatures from aluminium and water. 7500 kg Al are needed for a 100% solar PV supplied dwelling in Central Europe.

Why is aluminum a good source of energy?

Although aluminum production is very energy intensive process with high greenhouse gas emissions, some physical-chemical properties of aluminum are very attractive for energy storage and carrying. Among them there are zero self-discharge and high energy density. Aluminum can be stored for a long time and transported to any distance.

Is aluminum a good energy storage & carrier?

Aluminum is examined as energy storage and carrier. To provide the correct feasibility study the work includes the analysis of aluminum production process: from ore to metal. During this analysis the material and energy balances are considered. Total efficiency of aluminum-based energy storage is evaluated.

Can aluminium redox cycles be used for energy storage?

Aluminium redox cycles are promising candidates for seasonal energy storage. Energy that is stored chemically in Al may reach 23.5 MWh/m<sup>3</sup>. Power-to-Al can be used for storing solar or other renewable energy in aluminium. Hydrogen and heat can be produced at low temperatures from aluminium and water.

Why is aluminum a good material?

Aluminum has a high specific energy (31 MJ/kg), is safe and easy to store and transport, has a low risk of premature or accidental oxidation if particles are coarse enough, and can be recycled indefinitely. When aluminum oxide is reduced to aluminum, the energy state of the material increases.
