Can a compressed air energy storage system be applied to public buildings?

Unlike the conventional compressed air energy storage (CAES) system and related technology, which relies on unique geological or needs plenty of renewable energy like solar or wind energy, the proposed system in this work can be applied to public buildings in metropolis. It is an environment-friendly system.

What is a novel compressed air energy storage system?

System description Based on electrical energy peak load shifting, a novel compressed air energy storage system for the trigeneration of electricity, heating and cooling power is proposed for hotels, hospitals or other large public buildings. The schematic of the novel type of system is shown in Fig. 1.

What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) technology has received widespread attention due to its advantages of large scale, low cost and less pollution. However, only mechanical and thermal dynamics are considered in the current dynamic models of the CAES system. The modeling approaches are relatively homogeneous.
