

# Can smart mattresses store electricity does it contain formaldehyde

How to avoid mattress chemicals?

If you want to avoid mattress chemicals, you have an increasing number of options. First, when you're shopping for mattresses, carefully research the production process. Then, if you do choose a traditional mattress, let it off-gas in a well-ventilated area for at least a few days.

Is polyfoam causing mattress chemicals?

Polyfoam isn't the only culprit for introducing mattress chemicals, unfortunately. Mattresses available today, especially crib mattresses, may incorporate vinyl to reduce fluid absorption. But vinyl is another petroleum-based product, which means chemicals are involved in its production. As an alternative to polyfoam, some manufacturers use latex.

Is your mattress toxic?

To make matters worse, recent research suggests that when you lay on your mattress, the heat from your body triggers additional off-gassing. That means that when you're closest to your mattress, it's releasing more of its internal toxic chemicals than at any other time. Let's circle back to our original question:

Do mattress manufacturers have to disclose flame retardant?

Manufacturers aren't required to disclose all the materials used in their mattresses. While the inner filling, often made with polyurethane foam, is typically listed on the tag, there is no requirement to disclose the specific type of flame retardant used. So consumers may be unsure of what's in their mattresses.

Why does my mattress smell like a chemical?

Chemical off-gassing occurs when an item releases volatile organic compounds (VOCs) into the air. You might have experienced off-gassing firsthand. If you've brought a new mattress home only to get hit with a chemical-like smell, your mattress was probably off-gassing. Polyfoam, flame retardants and other mattress chemicals all off-gas.

What happens when a mattress releases VOCs into the air?

This is the phenomenon that occurs when a mattress and its associated materials release volatile organic compounds (VOCs) into the air. These VOCs can include formaldehyde, toluene, chlorofluorocarbons (CFCs), benzene, trichloroethane, and perfluorocarbons, though each mattress is different and may release different chemicals.

Global Organic Textile Standard (GOTS) certifies mattresses that are at least 70 percent made of organic natural materials and which don't contain flame retardants, phthalates, or other ...
