What is energy storage in an inductor?

Energy storage in an inductor is a function of the amount of current through it. An inductor's ability to store energy as a function of current results in a tendency to try to maintain current at a constant level. In other words, inductors tend to resist changes in current.

How does a Magnetic Inductor store more energy?

To store more energy in an inductor, the current through it must be increased. This means that its magnetic field must increase in strength, and that change in field strength produces the corresponding voltage according to the principle of electromagnetic self-induction.

What is the rate of energy storage in a Magnetic Inductor?

Thus, the power delivered to the inductor  $p = v \cdot i$  is also zero, which means that the rate of energy storage is zero as well. Therefore, the energy is only stored inside the inductor before its current reaches its maximum steady-state value,  $I_m$ . After the current becomes constant, the energy within the magnetic becomes constant as well.

Why do inductors behave differently than resistors?

Because inductors store the kinetic energy of moving electrons in the form of a magnetic field, they behave quite differently than resistors (which simply dissipate energy in the form of heat) in a circuit. Energy storage in an inductor is a function of the amount of current through it.

Why is an inductor discharging?

In this condition the inductor is said to be discharging, because its store of energy is decreasing as it releases energy from its magnetic field to the rest of the circuit. Note the polarity of the voltage with regard to the direction of current.

What are the dangers of an inductor in an electrical circuit?

Inductive reactance is the opposition that an inductor offers to alternating current due to its phase-shifted storage and release of energy in its magnetic field. Reactance is symbolized by the capital letter "X" and is measured in ohms just like resistance (R). Inductive reactance can be calculated using this formula:  $X_L = 2\pi fL$
