The storage techniques used by electrical energy storage make them different from other ESSs. The majority of the time, magnetic fields or charges are separated by flux in electrical energy storage devices in order physically storing either as electrical current or an electric field, and electrical energy.

battery can store more total energy than a capacitor, but it cannot deliver it very quickly, which means its power density is low. Capacitors, on the other hand, store relatively less energy per unit mass or volume, but what electrical energy they do store can be discharged rapidly to produce a lot of power, so their power density is usually high.

The selection of energy storage devices is primarily influenced by the technical characteristics of the technologies [36]. When investigating any energy storage systems" technical potential, the common factors that are mainly considered are the energy density, power density, self-discharge, lifetime, discharge durations, and response time [136].
