For the clockwork axion models with a PQ scale $f \ll 10^6$ GeV, the domain walls produced from the phase transition would dominate the energy density of the Universe and have therefore been excluded. We find that GWs produced from the annihilation of ...

Clockwork power, in the sense of energy storage by a coiled spring, is one of the oldest means of applying

power known to man, being invented between 1500 and 1510 by Peter Henlein of Nuremberg. The most common use of clockwork was in, er, clocks, but this page restricts itself to its attempted use as a propulsive power.

How this energy density might be usefully exploited is discussed at the end of a Nature Nanotechnology paper describing this research: "Giant nanomechanical energy storage capacity in twisted single-walled carbon nanotube ropes". UMBC worked with Suwa University of Science (Chino, Japan), Shinshu University and the University of Johannesburg.

The energy storage density of clockwork systems can be appreciated as follows: 1. Energy storage capacity is influenced by the materials used, including the type of spring to achieve optimal performance; 2. But the road to clean energy has a major obstacle: infrastructure that's unreliable, unpredictable, and full of friction. We're serious about making EVs the future, and a driver's ability to charge the first time they try isn't optional--it's everything. So, we built Clockwork to fix it.
