To protect the boiler by Wet Storage: o Fill the boiler to the normal operating level with deaerated feedwater o Add treatment described previously o Boil the water gently for 1 hour to afford mixing (vents should be open; maintain a safe water level) o Raise the boiler's water level with deaerated water to eliminate any

The influence of the water storage tank size and the air source heat pump size on the energy saving potential of the energy storage heating system is investigated comprehensively. The results show that even a small water tank, i.e., 0.06 m<sup>3</sup> ~ 0.5 m<sup>3</sup>, can reduce the start-stop loss of the air source heat pump effectively.
