Can underground space energy storage technology be used in abandoned coal mines?

The underground space resources of abandoned coal mines in China are quite abundant, and the research and development of underground space energy storage technology in coal mines have many benefits.

Can abandoned coal mine facilities be used to generate energy?

Thus, the abandoned mine facilities are efficiently used to generate both electrical and thermal renewable energy. Fig. 5. Combined design of underground energy storage systems (UPHES and CAES) and geothermal utilization in an abandoned underground coal mine.

What is coal underground thermal energy storage?

Coal underground thermal energy storage (CUTES) is a form of energy storage that makes extensive use of the underground highways in closed mines as a place to store energy and to offer heating and cooling in the winter and summer months, respectively.

Why do we use coal to develop underground space resources?

While making full use of coal to develop underground space resources, it realizes power conversion and storage, stabilizes the power system's cycle and voltage, promotes the circulation of mine water, and guarantees flood storage and water transfer.

Can a pumped storage power plant improve a coal mine's Peak regulation mode?

The construction of a pumped storage power plant within an underground coal mine has the potentialto improve the power system's peak regulation mode as well, but also solve the contradiction between energy and load. Although it is a novel approach, there are still some dangerous obstacles to overcome before garbage can be used effectively.

What are underground energy storage and geothermal applications?

Underground energy storage and geothermal applications are applicable to closed underground mines. Usually, UPHES and geothermal applications are proposed at closed coal mines, and CAES plants also are analyzed in abandoned salt mines. Geothermal power plants require flooded mines, which generally have closed more than 5 years ago.

A new sort of large-scale energy storage plant is the abandoned mine gravity energy storage power station. It features a simple concept, a low technical threshold, good reliability, efficiency, and a huge capacity [27]. The abandoned mine gravity energy storage power station lifts the weight through a specific transportation system to drive the generator set to ...

In China, every 100 Mt of coal produced will produce 14 Mt of coal mine waste, whilst every 100 Mt of washed coal produced will result in 20 Mt of washery waste containing unrecovered coal. It is recognised that

coal mine waste is a good fuel for CFB and coal mines are now encouraged to build CFB plants to burn such waste. The State Energy ...

EDL pioneered the process of capturing and converting waste coal mine gas (WCMG) generated during coal mining in Australia. WCMG is produced during coal mining as methane gas trapped in coal seams is released. As this ...

The energy storage and generation from abandoned coal mines and mine reservoirs is about 1.5 times of China's total annual power generation in 2014 (Ge et al., 2020). Under the new circumstances, General Secretary Xi Jinping declared at the 75th Session of the UN General Assembly that China aims to reach peak carbon dioxide emissions by 2030 ...

Closed mines can be used for the implementation of plants of energy generation with low environmental impact. This paper explores the use of abandoned mines for Underground ...

The results show that: for the mine water with TDS mass concentration of 3200 mg/L, coagulation clarification process is used for pretreatment, reverse osmosis+DTRO is ...

Encourage the safe utilization, cascaded utilization, and large-scale utilization of coal mine methane by means of household use, CNG, LNG, concentration, power generation, ...

New studies on the framework of a circular economy have led to find new possibilities for mine water which can be considered as a potential resource, converting mining ...

In particular, underground pumped hydroelectric energy storage systems (UPHS) constitute efficient and flexible alternatives to deal with intermittent renewable energy sources. ...

The coal-based energy industry has a wide range of businesses including coal mining, utilization, and conversion. Coal mining is the process of extracting coal from the ground, coal utilization mainly refers to the use of coal for power generation, and coal conversion involves the modern coal chemical industry.

Electrochemical Energy Storage; Flexible Loads and Generation; Grid Integration, Controls, and Architecture ... Potential for human health risks is also expected to increase due to increased heavy metals in water from increased coal mining and MEA hazardous waste, although there is currently not enough information to relate this potential to ...

The distribution of China's coal resources is very uneven, with over 80% located in the north and northwest of the country. As shown in Fig. 13.1, however, the main consumption areas are in the east and south, meaning that there is great discord between production location and area of demand.Based on the distribution and availability of energy resources, it is clear ...

Subsidence can occur from room and pillar or longwall coal mining and can cause damage many years later. Acid mine drainage is a problem from abandoned metal and coal mines, polluting waterways with acid and heavy ...

The use of underground space energy storage in coal development should be based on the comprehensive consideration of mine well type, space depth, geological ...

Waste from coal mining is managed, however only in 44%. Among the waste related to coal mining and processing, the following types of waste are distinguished: flotation, slag, bottom ash and fly ash. ... It is practically impossible to prevent the generation of post-mining waste. Tailings are troublesome to handle due to their high abundance ...

Energy generation from coal tailings is covered in more detail in the sub-section below. ... The coal mining waste materials deposited within the waste dumps or spoil heaps are very varied and because there was no perceived commercial value, disposal costs were minimized and, as a result, their contents are usually unknown and could also ...

In the context of the new normal of economic development and supply-side reform, it is imperative to close mines and open pits with depleted resources and outdated production capacity with the advancement of the coal production capacity reduction policy [1]. According to incomplete statistics, the number of coal mines closed during 2016-2020 due to resolving ...

the ratio of coal used for power generation relative to the total coal consumption increased from 26.0% to 44.6% in the Meduni?, G., Mondol, D., Ra?enovi?, A., Nazir, S.

In the 11th Five-Year Plan (2006-2010) for national economic and social development, the government stipulated a targeted 20% reduction in energy consumption per unit gross domestic product (GDP) in 2010 relative to that in 2005, and a 10% reduction in SO 2 emissions. To meet this target while continuing the robust development of China''s power ...

At present, the application of underground electrochemical energy storage systems in coal mines is not extensive, so the safe operation system of underground electrochemical energy storage in coal mines, including the construction of supervision and management systems, is not reasonable, which can easily lead to the low efficiency of ...

In particular, mine water can be used to generate hydro-power (Jardón et al. 2013) and store energy, for example by means of the underground pumped hydroelectric energy ...

The mining industry contributes significantly to the world"s economy. Mining resources are utilized for different purposes, including ornaments, jewellery, cable wires, building purposes, vehicles, electricity production, high-tech applications, etc. [1, 2]. The process of mining and purification of mineral resources requires high volumes of water, which is released into the ...

Across the U.S., former coal mines and power plants are becoming fertile ground for renewable energy projects like wind, solar, and battery storage.

As planners and policymakers look to engineer a zero-carbon power grid, they will require a diverse mix of electricity generation and energy storage solutions to maximize stability and minimize ...

Coal mining and energy production have significant impacts on the environment, jeopardizing the sustainable use of coal as the primary energy (Ribeiro et al., 2016). Coal gangue, a solid waste generated during coal mining and washing, accounts for approximately 10%-15% of the total coal production.

Open cut & underground coal mining operations generate significant amounts of waste gas (primarily methane). Traditionally, this potent greenhouse gas has been vented or flared, ...
