

Common interfaces for energy storage power supply

How to connect electrochemical energy storage system to electrical network?

To interconnect these systems to the electrical network, it is required to use power electronic interfaces. Various power electronic converters for the interface between the electrochemical energy storage system and the electrical network have been described. These power converters are divided into standard, multilevel and multiport technology.

What is a power electronics interface?

The design of the power electronics depends on the specific energy source or storage application. The power electronics interface accepts power from the distributed energy source and converts it to power at the required voltage and frequency.

What are the most common power electronics interfaces for DE applications?

The most common power electronics interfaces for DE applications are discussed next where it is assumed that the DE systems are connected to the three-phase utility and galvanic isolation is required between the DE systems and the utility. There are some transformer-less configurations available in literature that can be used for the DE systems.

Which power electronics are required for a battery energy storage system?

The power conditioning systems, including inverters and DC-DC converters, are often required for the battery energy storage systems (BESSs). The most unique aspect to power electronics for BESS is that they must be bidirectional, that is both taking power (during charging) and providing power (during discharge) from/to the grid.

What are energy storage devices & energy storage systems?

Appropriate energy storage devices (ESDs) and energy storage systems (ESSs) are core elements of highly demanded resource efficient, environmentally-friendly and reliable solutions for mobile and stationary applications, which are topics of highest priority in the EU policy targeted to a low carbon sustainable economy.

Why do we need a power electronics interface (PEI)?

Because of the similar functions of these power electronics capabilities, the development of a power electronics interface (PEI) that is scalable to meet different power requirements, with modular design, lower cost, and improved reliability, will improve the overall cost and durability of distributed and renewable energy systems.
