## Conclusion of the experiment on the principle of inductive energy storage

lithium-ion batteries are widely used in high-power applications, such as electric vehicles, energy storage systems, and telecom energy systems by virtue of their high energy density and long cycle life [1], [2], [3]. Due to the low voltage and capacity of the cells, they must be connected in series and parallel to form a battery pack to meet the application requirements.

They serve as temporary energy storage devices. In electronic devices like cameras and flashes, capacitors accumulate energy and discharge it rapidly when needed, as in the case of a camera flash. In electric motors, ...

Any such justification is circular because it uses an inductive principle to justify an inductive principle. Perhaps we can justify one inductive principle in terms of another, but ultimately there will be an inductive principle for which we can supply no non-circular justification. In any event, the issue of noncircular justification is not ...
