

How does exchange-induced Valley-mixing of exciton affect light-matter interactions in TMD-ml?

The exchange-induced valley-mixing of exciton leads to the unusual linear energy dispersions of exciton, which, as shown later, directly impacts the generic light-matter interactions of TMD-ML's, including that for the exciton-mediated energy transfer.

Are atomically thin TMD-ml's energy transfer influenced by Dark excitons?

Remarkably, the energy-transfer responses of atomically thin TMD-ML's are shown to be dictated by the momentum-forbidden dark excitons rather than the commonly recognized bright ones.

Why are dark exciton states important?

Dark exciton states show great potential in condensed matter physics and optoelectronics because of their long lifetime and rich distribution in band structures. Therefore, they can theoretically serve as efficient energy reservoirs, providing a platform for future applications.

Does exciton-mediated Förster resonant energy transfer from photo-excited quantum dots?

In summary, we present a theoretical investigation of exciton-mediated Förster resonant energy transfers from photo-excited quantum dots to monolayer TMD's.

Dark Energy is supposed to substantiate the theory of cosmic inflation; the substance itself is a hypothetical one. There is also a little controversy, though: Albert Einstein provided the idea with his cosmological constant but without evidence it fell by the wayside - the result being its exclusion from certain fields of physics, while still being useful to others, ...

It is here that among the methods of energy storage, hydrogen production currently takes relevance for its energy density, high energy capacity and transportability [2], [3]. Moreover, in the same direction, there is the concern about pollution in the transportation sector.

This also connects ultimately with the quantum vacuum which plays the role of a constant energy density responsible for the accelerated expansion of the universe. The details and fundamental understanding of this are as yet ...

The point of all this is that light cannot be dark energy because its density is given by the wrong equation - equation (2) not equation (3). For the same reason matter cannot be dark energy either. Dark energy must be something that doesn't behave like matter or light. What that something is we simply don't know (yet).
