How does a fan coil unit work?

A fan coil unit works by using a fan to move air through a heating or cooling coil to condition the air in a space. In its simplest form, a fan coil unit consists of a fan and a coil: Fan: The fan is used to circulate air through the fan coil unit and the conditioned space.

What is a fan coil system?

A fan coil system consists of a number of fan coil units linked together in control groups. Fan coil units can be evaluated against other air conditioning systems such as constant volume all-air central plant, single/dual duct VAV, chilled beams/ceilings, water loop heat pump or split/multi-split systems. How is outdoor air fed to the room in decoupled ventilation?

In decoupled ventilation air, the air from the outdoor air system is fed directly to the room without entering the fan coil unit. This means it's totally independent of the FCU. Fan coils are limited on their coil, fan and filter capacities.

Is a fan coil unit considered an air handler?

In commercial HVAC, a fan coil unit is a specific type of air handler. It uses a fan to recirculate the air in a space and a coil to heat or cool the air as it passes through the unit. However, if the unit brings in any outside air using its fan, then it is technically not a fan coil unit.
