

A supercapacitor with graphene-based electrodes was found to exhibit a specific energy density of 85.6 Wh/kg at room temperature and 136 Wh/kg at 80 °C (all based on the total electrode weight), measured at a ...

Graphene-based supercapacitors are one of highly promising electrochemical energy-storage devices, but remain great challenges in achieving high volumetric energy density due to lacking of the efficient strategy in optimal balance between the mass density and the gravimetric capacitance of graphene electrodes. Here we demonstrate a novel strategy ...

The graphene-based materials are promising for applications in supercapacitors and other energy storage devices due to the intriguing properties, i.e., highly tunable surface area, outstanding electrical conductivity, good chemical stability and excellent mechanical behavior. This review summarizes recent development on graphene-based materials for supercapacitor ...

We present a review of the current literature concerning the electrochemical application of graphene in energy storage/generation devices, starting with its use as a super ...

Despite high power density, fast charging/discharging rate, and long operational lifetime, large-scale application of supercapacitor (SC) is limited by its intrinsically low energy densities (of 5-8 Wh kg⁻¹ (gravimetric) and 5-8 Wh L⁻¹ (volumetric)), which are at least 10-fold lower than battery. Since the invention of graphene in 2004, graphene-based SCs have set ...

Moreover, the utilization of GO within the battery system, its shows notable enhancement in the ion mobilization, energy storage capacity, effective control mechanism of active materials and improved recycling process. Moreover, the Table 1 representing the applications of few graphene-based nanocomposites in energy field.

In pursuing higher energy density with no sacrifice of power density, a supercapacitor-battery hybrid energy storage device--combining an electrochemical double layer capacitance (EDLC) type positive electrode with ...

A graphene aerogel co-doped with sulphur and nitrogen offered current density of 1 Ag⁻¹, specific capacitance of 203 Fg⁻¹ and energy density of 101 WhKg⁻¹ [78]. The boron and nitrogen co-doped monolithic graphene aerogels and active materials shows improve electrochemical performance [79], [80], [81] .

The need for high-performance and environmental friendly energy storage systems has prompted researchers

to develop novel and improved electrode materials that can meet the rapidly expanding ...

Various technologies have been developed for the safe and efficient storage of hydrogen. Hydrogen storage in its solid form is an attractive option to overcome challenges such as storage and cost. Specifically, ...

Both strategies have achieved notable improvements in energy density while preserving power density. Graphene is a promising carbon material for use as an electrode in electrochemical...

The applications of dense graphene-based assemblies in energy storage, thermal management, and electromagnetic interference (EMI) shielding are summarized. Finally, their challenges and prospects in future research are outlined. This review provides a reference for exploring and developing their large-scale, cost-effective manufacture and use.

The fast development of the energy storage market, including electronic devices and electric vehicles, is making continuing demands for higher energy density [1], [2], [3] addition to the usual concerns regarding the range or running time for electric vehicles and electronic devices, "space anxiety" is emerging due to the batteries occupying a very large ...

With the increasing of energy demand and consumption of non-renewable energy, seeking new energy sources obtains more and more attentions. Energy storage capacitors with various advantages can well undertake this responsibility, and it has become a focus of increasing attention due to its convenience, high efficiency and environmental protection [[1], [2], [3]].

Graphene is a two-dimensional (2D) thin-film carbon material composed of carbon atoms with sp² hybrid orbitals forming a hexagonal honeycomb lattice. It is a new type of nanomaterial and one of the most popular frontier materials in current research [1, 2]. The concept of graphene was first proposed by Wallace in 1947, which opened the theoretical study of graphene [3].

This, combined with the high conductivity of this material makes it very attractive for creating the conducting plates of supercapacitors in order to achieve a greater energy storage density in the supercapacitors. [2] Recently, ...

Carbon-based materials are more effective electrodes for creating energy storage devices because of their large surface area, 2D layered structure, and intrinsic capacitance of up to 21 mF cm⁻² cause of its distinct electrical characteristics resulting from the existence of both sp² and sp³ carbon [15]. Graphene sheets contain oxygenated functional groups like epoxide and ...

The newly-developed AIB also exhibited a high energy density of 58 Wh kg⁻¹ at a corresponding power density of 26 kW kg⁻¹, which were comparable to those of conventional energy storage devices. The achieved wire-shaped GF-based AIB can well maintained its electrochemical performance under different bending

states and long-term bending ...

Graphene has a surface area even larger than that of the activated carbon used to coat the plates of traditional supercapacitors, enabling better electrostatic charge storage. Graphene-based supercapacitors can store almost as much energy as lithium-ion batteries, charge and discharge in seconds and maintain these

The efficiency of PCM is defined by its effective energy and power density--the available heat storage capacity and the heat transport speed at which it can be accessed [7].The intrinsically low thermal conductivity of PCMs limited the heat diffusion speed and seriously hindered the effective latent heat storage in practical applications [8].Many efforts have been ...

In a different approach, porous and dense graphene foams were developed for efficient capacitive energy storage by digging nanoholes in the basal planes of graphene and using a hydraulic press to ...

For addressing the challenges of balancing the rapid ion transport channels and volumetric/areal energy storage capability at a dense fashion, here an exceptional conductive graphene papers that are well stacked by conductive graphene nanosheets have been demonstrated as an electrochemically stable host for stable Al-ion battery cathodes with high ...

SCs are the high power density electrochemical energy storage devices, occupying the top left quadrant in the Ragone plot of energy density (amount of stored energy in a certain mass, Wh kg^{-1}) and power density (time rate of energy transfer in a certain mass, kW kg^{-1}) (Gogotsi and Simon, 2011).They have a very long-life cycle and a high degree of flexibility in ...

In the organic system, Bisazo-rGO-3 exhibits an impressive energy density of 49.5 Wh kg^{-1} at a moderate power density (1350 W kg^{-1}). Even at a high-power density of $27,000 \text{ W kg}^{-1}$, the energy density remains substantial at 40.5 Wh kg^{-1} , underscoring its excellent energy storage performance (Fig. S14). We also subjected it to 10,000 ...

Chemical vapor density graphene layer hydrazine reduction of graphene oxide (GO) in DMF/water mixture ... The energy storage is based on a faradaic redox reaction. Upon charging, Li ions permeate the anode and are reduced on it. Upon discharge, Li ions permeate to the cathode and are oxidized on it.

Supercapacitor (SC) was a typical electrochemical energy storage device with high power density, but suffered from relatively low energy density, which limited its application fields [[1], [2], [3]] creasing the energy density called for the electrode with high capacitance and stable operability when working at high voltage, as well as the high mass or volume ratio of ...

The exceptional energy storage performance of graphene can be attributed to its excellent electrical conductivity and elevated surface area. Graphene-based supercapacitors can transform portable electronics and

wearable devices, presenting a potential revolution in this field. ... Meanwhile, by increasing the packing density of materials based ...

Despite of widespread efforts, it is still not yet clear whether graphene could be widely used as a major active material or as an inactive additive in electrode of these EESDs [6] deed, there are a large number of scientific publications on graphene-based EESDs with high energy density and power density, most of which outperform the commercial EESDs ...

Graphene fibers (GFs) have attracted persistent attention since they are an important bridge of integrating graphene nano-sheets into macroscopic, advanced, and functional graphene-based materials [[1], [2], [3]].GFs not only have the unique features of common fibers, like softness, flexibility and lightweight, but also possess fascinating properties such as giant ...

The efficiency of a material for EC energy storage can be described by its specific volumetric capacitance in a single electrode (C vol) and energy density against the volume of two EC electrodes (E vol-electrode); the ...

The schematic synthesis of PMMA brush-modified graphene (rGO-g-PMMA) was based on the ARGET-ATRP method as illustrated in Fig. 1 (form Fig. 1 I-1III). Firstly, 0.2 g GO and 0.1 g DA were added into 400 ml of 50 mM Tris-HCl solution (pH = 8.5) and sonicated for 10 min under ice bath. ... The energy storage density of FGM-0.1 and FGM-0.2 ...

The capacitance of carbon-based electrode material is directly related to its SSA and pore structure, in accordance with the electric double-layer energy storage [[14], [15], [16]].Adjusting the pore structure to enhance SSA is an efficient method for increasing capacitance [17].However, increased porosity frequently results in a reduction in packing ...
