

Are dielectric polymers suitable for high temperature capacitive energy storage?

The electrification of transport and growing demand for advanced electronics require polymer dielectrics capable of operating efficiently at high temperatures. In this review, we critically analyze the most recent development in the dielectric polymers for high-temperature capacitive energy storage applications.

How do polymer dielectric energy storage materials improve energy storage capacity?

The strategy effectively suppresses electron multiplication effects, enhancing the thermal conductivity and mechanical modulus of dielectric polymers, and thus improving electric energy storage capacity. Briefly, the key problem of polymer dielectric energy storage materials is to enhance their dielectric permittivity.

Do dielectric materials maintain high-temperature capacitive energy storage?

Nature Materials (2025) Cite this article High-temperature capacitive energy storage demands that dielectric materials maintain low electrical conduction loss and high discharged energy density under thermal extremes.

Can polymer dielectric materials be used in energy storage film capacitors?

For the realization of engineering applications of polymer dielectric materials in energy storage film capacitors, the most significant precondition is fabricating dielectric polymer films with fine structures and tunable macroscopic natures on a large scale through utilizing scalable, reliable, and cost-efficient film processing technologies.

What is the energy density of energy storage dielectric materials?

Especially, for the preparation of high-performance energy storage dielectric materials, an energy density of $> 35 \text{ J cm}^{-3}$ and $> 4 \text{ J cm}^{-3}$ at room temperature and high temperature conditions, respectively, can often be achieved through ingenious designs.

What is dielectric polymer used for?

Recent advances in dielectric polymer materials accelerate the progress of prototypical capacitor systems with wide-ranging applications across information electronics, flexible intelligence, pulsed power equipment, medical devices, green energy, deep sea and deep space exploration, as well as national defense and military industry.

The rapid development of clean energy provides effective solutions for some major global problems such as resource shortage and environmental pollution, and full utilization of clean energy necessitates ...

Recently, some polymers having relatively high dielectric constant have been synthesized, while either the other dielectric properties (e.g., high dielectric loss, high electrical conductivity, low breakdown strength) or the mechanical and processing properties can fulfill the requirement for dielectric and energy storage applications [2], [19 ...

Two-dimensional (2D) materials are widely used in various fields because of their excellent thermal, electric and mechanical properties. Polymer nanocomposite dielectrics (PNDs) reinforced with 2D materials exhibit remarkably improved properties, showing great potential in dielectric and energy storage applications. This review summarizes various 2D filler-reinforced ...

For linear dielectrics, the energy density (U_e) equation is described as follows: (Equation 1) $U_e = 0.5 \epsilon_0 \epsilon_r E_b^2$ where ϵ_0 is the vacuum dielectric constant, ϵ_r is the relative dielectric constant and E_b is the breakdown strength. The dielectric constant (ϵ_r) and breakdown strength (E_b) are two key parameters to evaluate energy density. Polymer dielectrics with high ...

In recent years, researchers used to enhance the energy storage performance of dielectrics mainly by increasing the dielectric constant. [22, 43] As the research progressed, the bottleneck of this method was revealed. [] Due to the different ...

Polymer nanocomposite dielectrics (PNDs) reinforced with 2D materials exhibit remarkably improved properties, showing great potential in dielectric and energy storage applications. This review summarizes various 2D filler-reinforced PNDs, involving carbon materials, MXenes, oxide ceramics, clays, boron nitride and so on.

The achieved maximum theoretical energy storage density reached 2.87 J/cm³. At an electric field of 100 kV/cm, the effective energy storage density is 0.23 J/cm³, and the energy storage efficiency is 72 %. These findings demonstrate the broad application potential of the CSNNS glass-ceramics in the domain of pulse power, highlighting their ...

Dielectric capacitors have garnered significant attention in recent decades for their wide range of uses in contemporary electronic and electrical power systems. The integration of a high breakdown field polymer matrix with ...

Electrical energy storage technologies play a crucial role in advanced electronics and electrical power systems. Electrostatic capacitors based on dielectrics have emerged as promising candidates for energy ...

the current dielectric polymers. Different from prior reviews covering the high-temperature dielectric polymer composites,^{47,48,58,59,76-79} this article exclusively focuses on the recent innovations in all-organic dielectric polymers that are designed for capacitive energy storage applications at high

Polymer dielectrics face huge challenges in the harsh environments of emergent applications. Now, increased

energy storage of polymer dielectrics at temperatures up to 250 °C by designing ...

In this project, the oxidative chemical polymerization method is used to prepare polymer composite that consisting of polypyrrole polymer (PPy) and iron oxide nanoparticles (Fe₂O₃NPs). Then deposited this blend ...

However, the compatibility of high energy density and efficiency remains a significant challenge. Most polar polymer dielectric films suffer a considerable drop in capacitive ...

Polymer-based film capacitors are increasingly demanded for energy storage applications in advanced electric and electronic systems. However, the inherent trade-offs ...

Here, we report a sandwich-structure polyetherimide (PEI)-boron nitride nanosheet (BNNS)/polyvinylidene fluoride and polymethyl methacrylate (PVDF& PMMA)-HfO₂/PEI ...

The Polyvinylidene fluoride (PVDF) is a very important polymer for technological applications, because it has interesting physical properties (dielectric, piezoelectric, ferroelectric, pyroelectric etc.) [1]. One or more physical properties of PVDF can be used to develop devices, such as capacitors, energy storage devices, piezoelectric sensors, ferroelectric random ...

This work proposes an all-organic dielectric film with a nano-submicron surface layer, aiming to address the limitations of P(VDF-HFP)-based polymers for energy storage applications.

This article presents an overview of recent progress in the field of nanostructured dielectric materials targeted for high-temperature capacitive energy storage applications. Polymers, polymer nanocomposites, and bulk ceramics and thin films are the focus of the materials reviewed. Both commercial products and the latest research results are ...

One such dielectric displays an energy density of 8.3 J cc⁻¹ at 200 °C, a value 11 %; that of any commercially available polymer dielectric at this temperature.

Polymer dielectrics possess the advantages of excellent mechanical properties, high dielectric breakdown strength and good processability, their dielectric properties at elevated temperatures for energy storage need substantial improvement. Polymer nanocomposites have been configured by integrating the merits of both polymers and ceramics to improve ...

In this work, we report that a polymer dielectric sandwiched by medium-dielectric-constant, medium-electrical-conductivity (s) and medium-bandgap nanoscale deposition layers exhibits outstanding high-temperature energy storage performance. We demonstrate that dielectric constant is another key attribute that should be taken into account for the selection of ...
