

What materials are used for hydrogen storage?

Storage of the hydrogen needs metallic materialsthat have the ability to absorb and desorb the hydrogen. In this chapter,we will discuss the characteristics of different types of alloys that are used in the hydrogen storage; also,we will show the suitable industrial applications for each alloy type.

In physical storage,hydrogen is stored through compression and liquefaction. In chemical storage,hydrogen is stored through storing hydrides [4]. Metal hydrides are metals which have the ability to make a bond with hydrogen to produce new compound [5].

What is hydrogen storage based on?

Hydrogen storage can be divided according to whether it is based on physical or material storage(see Figure 1). Under physical storage,it is stored as a gas or liquid as a pure molecular compound with no significant physical or chemical bonding to other materials.
