Introduction. Nowadays, energy conversion and storage is a worldwide hotspot, as the rapidly developing society boosts the energy demand 1, 2 has been reported that over 80% of energy supply derives from fossil fuels including coal and oil, which brings serious environmental pollution 3. However, as known, the fossil fuel reserve is very limited and non-renewable 4.

Therefore, biochar and hydrochar are considered the simplest solution for the development of sustainable energy sources and environmental management (Maniscalco et al., 2020). The use of biochar and hydrochar carbon precursors from biomass as gas storage, energy storage, and conversion materials involves many challenges.

To avoid catastrophic global warming, transitioning away from fossil fuels as an energy source is more urgent than ever. Innovation in energy conversion and storage will play a key role in this massive global shift.

The increased demand for energy, the rise in the price of fuel associated with the depletion of fossil fuels, and the growth of CO₂ emissions all require the development of more energy-efficient processes and a shift from non-renewable energy sources to renewable energy sources. In this sense, thermal energy storage and

Additionally, energy storage technologies integrated into hybrid systems facilitate surplus energy storage

during peak production periods, thereby enabling its use during low production phases, thus increasing overall system efficiency and reducing wastage [5]. Moreover, HRES have the potential to significantly contribute to grid stability.

The main drawbacks of RESs are their unpredictability, intermittent nature, and need to consume generated energy immediately (Notton et al., 2018). Intermittent energy sources cause voltage and frequency disturbances that lower electrical grid reliability, stability, and quality (Ahmed et al., 2020). Therefore, demand-side management, generation-side management, geographical ...
