What is an energy bag?
An Energy Bag is a cable-reinforced fabric vesselthat is anchored to the sea (or lake) bed at significant depths to be used for underwater compressed air energy storage. In 2011 and 2012,three prototype sub-scale Energy Bags have been tested underwater in the first such tests of their kind.

What is compressed air energy storage?
Compressed air energy storage (CAES) is an energy storage technologywhereby air is compressed to high pressures using off-peak energy and stored until such time as energy is needed from the store,at which point the air is allowed to flow out of the store and into a turbine (or any other expanding device),which drives an electric generator.

Can energy bags be used for underwater compressed air storage?
Conclusions This paper has described the design and testing of three prototype Energy Bags: cable-reinforced fabric vessels used for underwater compressed air energy storage. Firstly,two 1.8 m diameter Energy Bags were installed in a tank of fresh water and cycled 425 times.

How does an underwater compressed air flexible bag energy storage system work?
Once the stored compressed air is needed, the underwater compressed air flexible bag energy storage device will deliver the low-temperature and high-pressure compressed gas to the power generation system on the barge, and the low-temperature and high-pressure compressed air will enter the heat exchanger that stores heat.

Is underwater compressed air flexible airbag energy storage isobaric?
From the above review,the energy release process of underwater compressed air flexible airbag energy storage is approximately isobaricdue to the action of water pressure,which is more efficient and has greater energy storage capacity than the current land-based CAES system,and has greater development potential.
