#### Does warm water energy storage improve cabin thermal management?

According to the results, this indicates that there will be a reduction in energy consumption of between 1.9 % and 3 % for a one-hour travel range in this electric vehicle. The findings of this investigation demonstrate that utilizing warm water energy storage effectively enhances cabin thermal management. 1. Introduction

Why is cabin heating important in electric vehicles?

Efficient cabin heating and thermal management in electric vehicles are crucial for enhancing passenger comfort, extending battery life, and optimizing overall energy usage, thus contributing to the sustainability and practicality of electric transportation. Heating the cabin of electric vehicles in winter has a negative effect on range.

Why is cabin heating and thermal control important in EVs?

The efficient management of cabin heating and thermal control in EVs is fundamental for improving passenger comfort, prolonging battery lifespan, and streamlining energy consumption, thus advancing the sustainability and feasibility of electric transportation.

Do integrated solar cells and heat storage systems improve cabin heating efficiency?

Through comprehensive experiments and analysis, the temperature variations, thermal energy transfers, and system performance metrics within the EV cabin environment was explored. The findings underscore the critical role of integrated solar cells and heat storage systems in enhancing cabin heating efficiency and sustainability.

#### What is thermal energy storage (TES)?

In recent years, Thermal Energy Storage (TES) technology, as a passive thermal management solution, has attracted more and more attention for applications in EVs due to enhanced cycle life, high overall efficiency, simple control procedure, fast heating and cooling response time and low energy costs.

How important is a cabin heat exchanger?

The increase in cabin temperature from 3 °C to 15 °C in a few minutes is very importantin creating interior comfort conditions. Furthermore, the cumulative heat transfer values peaked in Experiment 4 about 609.8 kJ, emphasizing the efficacy of the exchanger system in optimizing thermal energy utilization.
