How to configure a storage system in a new energy grid?

The configuration of the storage system in the new energy grid is divided into two modes: distributed and centralized configuration. The configuration methods are widely applied in wind farms. The distributed configuration is applied on the excitation DC link of a wind turbine or on the output terminal of each wind turbine.

### What is the difference between distributed and centralized energy storage systems?

Second, the distributed configuration is aimed at adjusting and controlling power of each wind turbine, so power and capacity of each storage system is small. The centralized configuration aims at adjusting and controlling the power of the farms, so the energy storage system boasts of larger power and capacity.
