The further downstream battery-based energy storage systems are located on the electricity system, the more services they can offer to the system at large. Energy storage can be sited at three different levels: behind the meter, at the distribution level, or at the transmission level. Energy storage deployed at all levels

(e.g. 70-80% in some cases), the need for long-term energy storage becomes crucial to smooth supply fluctuations over days, weeks or months. Along with high system flexibility, this calls for storage technologies with low energy costs and discharge rates, like pumped hydro systems, or new innovations to store electricity economically over longer

It also lowers risk for customers, because it relieves them of the responsibility and cost of predicting regional peak demand hours and dispatching their systems. Most programs allow customers to opt out of dispatch events without penalty, even though missing these dispatch calls typically lowers the customer's incentive payments for that period.
