How to achieve peak shaving in energy storage system?

This study discusses a novel strategy for energy storage system (ESS). In this study, the most potential strategy for peak shaving is addressed optimal integration of the energy storage system (EES) at desired and optimal location. This strategy can be hired to achieve peak shaving in residential buildings, industries, and networks.

Can energy storage system (ESS) integrate with the grid?

Many research efforts have been done on shaving load peak with various strategies such as energy storage system (ESS) integration, electric vehicle (EV) integration to the grid, and demand side management (DSM). This study discusses a novel strategy for energy storage system (ESS).

How to reduce peak load demand & power losses?

Different scenarios including the baseline case (without BESS),centralized BESS,and centralized BESS with PVare considered to reduce peak load demand and power losses,as well as to improve voltage profile during peak load hours.

What is peak load shaving in a distribution network?

Hence, peak load shaving is a preferred approach to cut peak load and smooth the load curve. This paper presents a novel and fast algorithm to evaluate optimal capacity of energy storage system within charge/discharge intervals for peak load shaving in a distribution network.

How to provide peak load?

To provide peak load, a conventional approach involving capacity increase(small gas power plants and diesel generators) is traditionally used. However, this approach is not economically feasible and inefficient in the use of generators because it is used to maintain production capacity for only a few hours a day .

Why is load demand a major challenge for electric utilities?

Load demand can be varied time to time in a single day. Meeting these changes, especially in the peak period is a major challenge for electric utilities . In general, commercial and industrial customer's peak demands differ considerably from their average load demands.
