All this takes materials and has an economic, environmental and human cost. Yet, energy is essential to everyday human life and at the heart of sustainability. The world needs a fast but fair transition to a low-carbon society to address global climate change. Scotland and Edinburgh are prime contexts in which to investigate such dynamics.

Energy comes from the natural environment and ecosystems. It is the basis of human activities, the driving force of socioeconomic development, and necessary for improving human well-being and living conditions [3, 4]. The use of energy also has feedback effects on the environment [5]. Therefore, energy is linked broadly with the sustainable development of ...

Clean, renewable, and sustainable energy is required daily to improve social, economic, and environmental health, leading to economic development and productivity. The aim of the work has deliberated on the reoccurrence of renewable energies to assist in the mitigation of climate change and environmental health excellently.

Shared energy storage can make full use of the sharing economy's nature, which can improve benefits through the underutilized resources [8]. Due to the complementarity of power generation and consumption behavior among different prosumers, the implementation of storage sharing in the community can share the complementary charging and discharging ...

The proposed study aims to overcome these shortcomings and limitations by developing a comprehensive sharing economy model for community energy storage that considers end-user comfort. The authors plan to conduct a detailed case study of a community energy storage system in order to evaluate the effectiveness of the proposed model in practice.

In the vision that follows, we will define an energy "economy" to describe the production, consumption, distribution, and dispensation network of a particular energy carrier and its dependent sectors, including the resultant business, economic, and environmental impacts. An energy "society" is supported upon several of these economies ...

However, in Scenario 2, the system uses shared energy storage to charge the shared energy storage during off-peak periods, increasing the electricity consumption during off-peak periods by 6.09 %; while during peak periods, the system uses shared energy storage to discharge, so that the peak period consumption. The power is reduced by 4.46 %.
