What is the difference between a resistor and a storag element?

electric and magnetic duals of each other, di er from resistors in several signi cant ways. Unlike resistors, which dissipate energy, capacit rs and inductors do not dissipate but store energy, which can be retrieved at a later time. They are called storag elements. Furthermore, their branch variables do not depend algebra

What is the capacity of a parallel group?

The capacity of a parallel group of cells is the sum of the capacity of the individual cells. For example, three 5Ah cells connected in parallel will give a total capacity of 15Ah. The nominal voltage of the group remains the same as that of a single cell.

Do storag elements depend on each other?

but store energy, which can be retrieved at a later time. They are called storag elements. Furthermore, their branch variables do not depend algebra cally upon each other. Rather, their relations involve temporal deriva-tives and integrals. Thus, the anal sis of circuits containing capac-itors and intia equations in tim

How to show a cell with internal resistance as a resistor in series?

Symbolically, we can represent a cell with internal resistance as a resistor in series. The DC internal resistance (R int or DCIR) is not a single number, as it varies with State of Charge, State of Health, temperature, and discharge time.

What is the nominal voltage of a parallel group?

The nominal voltage of the group of cells is the same as just one cell. The capacity of the parallel group is the sum of the capacity of the cells. Hence three 5Ah cells connected in parallel will give a total capacity of 15Ah.

Why is there resistance in the busbars?

When connecting cells in parallel, there is resistance in the busbars and in any joints. The busbar cross-sectional area, length, and joints all need to be considered. Small differences in resistance will result in different currents being delivered by each cell.
