

Can electric energy storage be used for drilling based on electric-chemical generators?

The article outlines development of an electric energy storage system for drilling based on electric-chemical generators. Description and generalization are given for the main objectives for this system when used on drilling rigs isolated within a single pad, whether these are fed from diesel gensets, gas piston power plants, or 6-10 kV HV lines.

Can drilling induced earthquakes start at the drilling phase?

We note that there is the potential for induced earthquakes starting at the drilling phase. Besides monitoring potential induced seismicity, the operator should also monitor drilling data such as mud losses, cuttings, well logs, and core recoveries, which might indicate the presence of faults (IMEPLS, 2016).

Do drilling mud gases respond to earthquakes?

Moreover, if the drilling site locates in area with high seismicity, it is reasonable to expect that the drilling mud gases will have visible responses to earthquakes, since the static or dynamic stress changes associated with them could affect the fluid migration behavior.

Is salt cavern oil energy storage feasible?

A comprehensive feasibility evaluation of the salt cavern oil energy storage system is proposed. The necessity and advantages of salt cavern oil storage are analyzed. The geological evaluation model is built to select the best site. A 3D stability numerical model under three working conditions is analyzed.

Does ESS ability ESS work on drilling rigs?

CJ70 jack-up drilling rig, also operating in the North Sea. The total capacity of the rig power unit is 11.6 MW. The were reduced by 25%. In its basic specifications, this ESS Ability ESS project. of ESS on drilling rigs is substantiated. Conclusions are modes on a number of rigs. Results of these studies laid a

Why do drilling mud gas changes lag earthquakes?

The drilling mud gas variations usually lag the earthquakes, and they respond to the aftershocks in different manners according to lithology encountered during the drill. The dynamic stress, rather than the static stress changes is responsible for the observed mud gas changes.
