

What are the environmental impacts of energy storage technologies?

Environmental impacts will depend on the scale and the sub-type of each technology, but some of the common impacts included: Social research is generally sparse for energy storage technologies, but perceptions tend to be more favourable when a technology is associated with 'green' energy, or when it is seen to provide local jobs.

Why do we need energy storage technologies?

Energy storage technologies are needed to ensure continuous supply during periods of low renewable energy production. Energy can be stored in a variety of forms (such as thermal, chemical or potential energy), all of which could have potential environmental impacts during construction, deployment or decommissioning.

What are energy storage technologies?

Energy storage technologies are considered essential to future renewable energy systems, but they often have high resource requirements and potentially significant environmental and social impacts that need to be appropriately managed in order to realise a sustainable energy system. concentrated solar power with thermal energy storage (CSP TES).

Are energy storage technologies safe?

Social research is generally sparse for energy storage technologies, but perceptions tend to be more favourable when a technology is associated with 'green' energy, or when it is seen to provide local jobs. Some technologies are associated with perceived safety concerns.

Why do energy storage technologies vary by region?

Energy storage technologies vary by region due to factors such as geography, technological maturity and policy support. Countries with abundant solar resources, like Australia and the Middle East, often use battery or concentrated solar power with thermal storage.

How will disruption affect the production of energy storage batteries?

Disruption in the supply of materials for batteries could affect the production of energy storage batteries, and as Australia has limited battery manufacturing established onshore, this could limit the supply of batteries.
