How do you calculate heat energy stored in granite?

The thermal heat energy stored in the granite can be calculated as  $q = (2 \text{ m}^3) (2400 \text{ kg/m}^3) (790 \text{ J/kg}^\circ\text{C}) ((40^\circ\text{C}) - (20^\circ\text{C})) = 75840 \text{ kJ}$   
 $q_{\text{kWh}} = (75840 \text{ kJ}) / (3600 \text{ s/h}) = 21 \text{ kWh}$   
 The heat required to heat 1 pound of water by 1 degree Fahrenheit when specific heat of water is 1.0 Btu/lb°F can be calculated as  $q = (1 \text{ lb}) (1.0 \text{ Btu/lb}^\circ\text{F}) (1^\circ\text{F}) = 1 \text{ Btu}$

energy stored at the charging time is calculated using Eq. 5. The energy stored in the sand fixed bed is 12.69 MJ. The energy storage rate of the bed is initially zero when there is no charged. Since the energy storage rate is function of volume average temperature of the storage bed, it has the same profile. Figure 4

Energy storage components improve the energy efficiency of systems by reducing the mismatch between supply and demand. For this purpose, phase-change materials are particularly attractive since they provide a high-energy storage density at a constant temperature which corresponds to the phase transition temperature of the material.
