Energy storage participates in thermal power frequency regulation

How to improve the frequency regulation capacity of thermal power units?

In order to enhance the frequency regulation capacity of thermal power units and reduce the associated costs, multi-constrained optimal control of energy storage combined thermal power participating in frequency regulation based on life loss model of energy storage has been proposed. The conclusions are as follows:

Can energy storage technology improve frequency regulation performance?

According to the above analysis, the energy storage technology can effectively improve the frequency regulation performance by assisting thermal power units to participate in power grid frequency regulation, and the control strategy proposed in this paper can prolong the service life of the energy storage system.

How does frequency regulation affect energy storage?

When the energy storage system must be charged under the condition of frequency regulation, the charge power absorbed by the energy storage system steadily decreases when the SOC is at a high boundary value, and it eventually cannot absorb the charge power when the SOC hits the critical value.

What is the frequency regulation control strategy of thermal power units?

Frequency regulation control strategy of the thermal power units combined energy storage systembased on multi-variable fuzzy control (Strategy II)

Can energy storage support the frequency regulation of thermal power units?

Comprehensive evaluation index performance table. Therefore, in the current rapidly developing new energy landscape where conventional frequency regulation resources are insufficient, the proposed strategy allows for more economical and efficient utilization of energy storage to support the frequency regulation of thermal power units.

Does battery energy storage participate in system frequency regulation?

Since the battery energy storage does not participate in the system frequency regulation directly, the task of frequency regulation of conventional thermal power units is aggravated, which weakens the ability of system frequency regulation.

1 INTRODUCTION. With the encouraging of low-carbon power generation in many countries, renewable energy generation such as wind power and photovoltaic is rapidly increasing. 1, 2 However, the volatility and ...

Currently, the power system mainly provides automatic generation control (AGC) frequency modulation function by traditional thermal power units, but its response speed to active power ...

In recent years, new energy power and other new energy power and other new energy power generations such
