

Which energy storage technologies are included in the 2020 cost and performance assessment?

The 2020 Cost and Performance Assessment provided installed costs for six energy storage technologies: lithium-ion (Li-ion) batteries, lead-acid batteries, vanadium redox flow batteries, pumped storage hydro, compressed-air energy storage, and hydrogen energy storage.

What is the cost of energy storage?

The cost of energy storage varies by technology. According to a 2018 report by RedT Energy Storage, the cost of their Gen 2 machines starts at \$490/kWh.

How to reduce the cost of energy storage?

Therefore, efforts to reduce cost of storage via engineering design are expected to gain traction. As long-duration energy storage (diurnal and seasonal) becomes more relevant, it is important to quantify cost for incremental storage in the cavern. The incremental cost for CAES storage is estimated to be \$0.12/kWh.

How are battery energy storage costs forecasted?

Forecast procedures for battery energy storage costs are described in the main body of this report. C&C or engineering, procurement, and construction (EPC) costs can be estimated using the footprint or total volume and weight of the battery energy storage system (BESS). For this report, volume was used as a proxy for these metrics.

How much does energy storage cost in 2025?

The red diamonds in the figure provide a forecasted cost for each energy storage technology for the year 2025 on a \$/kWh-yr basis. Pumped storage is forecasted to cost \$19/kWh-yr in 2025 when compared on an energy basis using 2018 values.

How long does an energy storage system last?

The 2020 Cost and Performance Assessment analyzed energy storage systems from 2 to 10 hours. The 2022 Cost and Performance Assessment analyzes storage system at additional 24- and 100-hour durations.

SOC prediction is crucial for accurate estimation of SOH. The open circuit voltage method used in reference [14] requires obtaining the SOC state open circuit voltage value through long-term standing. However, the open circuit voltage of lithium iron phosphate batteries in the range of 20 %-80 % SOC belongs to a flat region, and the trend of change is not obvious.
