Do storage elements depend on each other?

but store energy, which can be retrieved at a later time. They are called storage elements. Furthermore, their branch variables do not depend algebraically upon each other. Rather, their relations involve temporal derivatives and integrals. Thus, the analysis of circuits containing capacitors and inductors involves differential equations in time.

What is the difference between a resistor and a storage element?

Electric and magnetic fields are duals of each other, differ from resistors in several significant ways. Unlike resistors, which dissipate energy, capacitors and inductors do not dissipate but store energy, which can be retrieved at a later time. They are called storage elements. Furthermore, their branch variables do not depend algebraically upon each other.

What are electrical energy storage systems (EESS)?

Electrical energy storage systems (EESS) for electrical installations are becoming more prevalent. EESS provide storage of electrical energy so that it can be used later. The approach is not new: EESS in the form of battery-backed uninterruptible power supplies (UPS) have been used for many years. EESS are starting to be used for other purposes.

How does a capacitor store energy?

6.2.1. A capacitor is a passive element designed to store energy in its electric field. The word capacitor is derived from this element's capacity to store energy. 6.2.2. When a voltage source  $v(t)$  is connected across the capacitor, the amount of charge stored, represented by  $q$ , is directly proportional to  $v(t)$ , i.e.,  $q(t) = C v(t)$ .

Therefore, it is important to find the instantaneous values of the inductor voltage and current,  $v$  and  $i$ , respectively, to find the momentary rate of energy storage. Much like before, this can be found using the relationship  $p = \dots$

For this reason, it makes sense that (derivatives)  $\propto$  (energy storage elements). The reason why the order determines the number of energy storage elements is more mathematical. Imagine you have a series RLC circuit (two energy storage elements  $L$  and  $C$ ), and you write the loop equation for the voltage drops in terms of the loop current.
