What is tank thermal energy storage?

Tank thermal energy storage (TTES) are often made from concrete and with a thin plate welded-steel liner inside. The type has primarily been implemented in Germany in solar district heating systems with 50% or more solar fraction. Storage sizes have been up to 12,000 m³ (Figure 9.23). Figure 9.23. How much power does a discharging Tank Supply?

However, during the discharging mode, it is only required to supply 80% (average value) of the average power generated during the daytime since most of the discharging period is during night hours where the load is lower than that of day hours. The thermal energy storage density of the material used in the storage tank is 0.12 MWh/m³.

Is water tank storage a cost-effective storage option?

State-of-the-art projects have shown that water tank storage is a cost-effective storage option and that its efficiency can be further improved by ensuring an optimal water stratification in the tank and highly effective thermal insulation.

How does natural stratification occur in tank thermal energy storage?

Natural stratification occurs in tank thermal energy storage due to the different densities of water at different temperatures; hot water flows towards the top while cold water remains at the bottom, called thermal stratification.
