

What are the different types of thermal energy storage systems?

The best-known system is sensible-heat storage, such as buffer storage used in heating facilities. Thermal energy can also be held in latent-heat storage or thermochemical storage systems. This chapter describes the characteristics of these three technologies in detail. The term 'thermal-energy storage' also includes heat and cold storage.

How is thermal energy stored?

Thermal energy can generally be stored in two ways: sensible heat storage and latent heat storage. It is also possible to store thermal energy in a combination of sensible and latent, which is called hybrid thermal energy storage. Figure 2.8 shows the branch of thermal energy storage methods.

What is thermal energy storage (TES)?

Thermal energy storage (TES) is a technology that stocks thermal energy by heating or cooling a storage medium so that the stored energy can be used at a later time for heating and cooling applications and power generation. TES systems are used particularly in buildings and in industrial processes.

Can thermal energy storage systems be used in buildings?

It is possible to use thermal energy storage methods for heating and cooling purposes in buildings and industrial applications and power generation. When the final use of heat storage systems is heating or cooling, their integration will be more effective. Therefore, thermal energy storage systems are commonly used in buildings.

How energy is stored in sensible thermal energy storage systems?

Energy is stored in sensible thermal energy storage systems by altering the temperature of a storage medium, such as water, air, oil, rock beds, bricks, concrete, sand, or soil. Storage media can be made of one or more materials. It depends on the final and initial temperature difference, mass and specific heat of the storage medium.

What are the operational principles of thermal energy storage systems?

The operational principles of thermal energy storage systems are identical as other forms of energy storage methods, as mentioned earlier. A typical thermal energy storage system consists of three sequential processes: charging, storing, and discharging periods.
