

What are thermal energy storage strategies?

There are two basic Thermal Energy Storage (TES) Strategies, latent heat systems and sensible heat systems. Stratification is used within the tank as a strategy for thermal layering of the stored water. Colder water is denser and will settle toward the bottom of the tank, while the warmer water will naturally seek to rise to the top.

What are water-based thermal storage mediums?

Water-based thermal storage mediums discussed in this paper includes water tanks and natural underground storages; they can be divided into two major categories, based on temperature range and the state of water: sensible heat storage and latent heat storage. 2.1.1.

What is a hot water storage tank?

Hot water storage tanks can be sized for nearly any application. As with chilled water storage, water can be heated and stored during periods of low thermal demand and then used during periods of high demand, ensuring that all thermal energy from the CHP system is efficiently utilized.

How many ft<sup>3</sup>/ton-hour is a thermal energy storage tank?

Approximately 15 ft<sup>3</sup>/ton-hour is required for a 15F (8.3C) temperature difference. The greater the delta-t of the water, the smaller the tank can be. Tanks can store millions of gallons of water or much smaller amounts. There are dozens of various layouts for thermal energy storage system, but we'll cover the basic theory for its use.

What is a natural solar water based thermal storage system?

Natural solar water-based thermal storage systems While water tanks comprise a large portion of solar storage systems, the heat storage can also take place in non-artificial structures. Most of these natural storage containers are located underground. 4.1.

The DI water then rejects the heat it has absorbed to a TES system such as a hot water storage tank. Since the DI water cannot become contaminated, it must remain decoupled from the thermal storage medium. This is made possible through the use of a sensible (liquid) thermal energy storage tank with an immersed heat exchanger (IHX) coil.
