Energy storage water pump soft start control

Why are soft starters becoming the control of choice for centrifugal pumping systems?

Electronic starting and stopping of the pump motor is cost-effective and reduces surges or hammering problems. Here, Stuart Greenwood, product marketing manager for industrial control and automation at Eaton, explains why soft starters are becoming the control of choice for centrifugal pumping systems.

What is a soft starter controller?

The soft starter controllers continue to reduce the torque of the pump motorto ensure there are no sudden changes in flow that can cause hammering. Soft starter controllers with a pump control option produce the most desirable flow characteristics when starting and stopping centrifugal pump motors.

What is a soft starter?

SAF's reduced voltage starters are designed for the unique challenges of pump applications of today's clean water and wastewater pump applications. Soft starters play a key role in powering motors in various applications ranging from deep well pumps, vertical lift stations, aerators, grinders and clarifiers.

How to start and stop a pump?

There are three methods of starting and stopping a pump - direct on-line (DOL), solid-state reduced voltage (SSRV) starting and soft starter controllers with pump control option. The main concern with DOL starting is that the motor torque output more than exceeds the requirement of the pump during the start cycle.

What are soft start and Soft Stop features?

SAF's soft start and soft stop features reduce hydraulic and mechanical effects of inertial loading and water hammer on pumps, piping and mechanical components including shafts, impeller keyways, bearings, heat exchangers and check valves.

What is a SAF soft starter?

SAF soft starters offer accurate overload protection, current monitoring and high torque surge protection for electrical and mechanical equipment. Reduced torque starting helps lower maintenance costs of motors and their driven equipment while lowering costly peak power draw on startup and reducing voltage drops.

Use soft starters for pumps with a single job, like running one pivot. But, go for VFDs when dealing with pumps in places where water changes, such as a greenhouse--less on cool days, more on hot, sunny ones. Picking the ...

Connecting Soft Starters to Pump Systems. Connecting soft starters to pump systems may seem straightforward, but it requires attention to detail. First, proper wiring is ...

Varying pump performance by changing speed is most often the best energy-efficient control method. Figure 4

A conventional starter may generate enough pressure at startup to break the line. A soft starter offer gradual increase in the pressure to such liquid pumps. However, there is no speed control of the pump during normal ...

Under PLC control, just buy one "soft-starter" to start all four motors/pumps(only one motor/pump per pump start request) or Relieve the startup "work load" (27 feet of standing water) being ...

SAF soft starters offer accurate overload protection, current monitoring and high torque surge protection for electrical and mechanical equipment. Reduced torque starting ...

Soft starters are essential devices utilized in controlling the operation of electric motors, particularly in pump systems. Their significance arises from the need to manage the ...

Chip McDaniel, technical marketing at AutomationDirect: For most applications, the choice between a soft starter and a VFD boils down to the need for speed control.If across-the ...

The pump soft starter is a novel motor control device that integrates motor soft start, soft stop, light load energy saving and various protection functions. It is called SoftStarter ...
