What happens if a battery energy storage system is damaged?

Battery Energy Storage System accidents often incur severe losses in the form of human health and safety, damage to the property, and energy production losses.

What are Battery Energy Storage Systems?

Battery Energy Storage Systems are electrochemical type storage systems that produce electrical energy by discharging stored chemical energy in active materials through oxidation-reduction. Typically, these systems are constructed via a cathode, anode, and electrolyte.

How to reduce the safety risk associated with large battery systems?

To reduce the safety risk associated with large battery systems, it is imperative to consider and test the safety at all levels, from the cell level through module and battery level and all the way to the system level, to ensure that all the safety controls of the system work as expected.
