Can batteries be used in the harsh environment of space?

Developing safe energy storage for use in the harsh environment of space. Batteries for aerospace applications are a technological challenge. They need to be higher performance and safer than terrestrial batteries, while still being able to operate in some very harsh environments.

What batteries are used in space?

The primary batteries used for space applications include Ag Zn, Li-SO<sub>2</sub>, Li-SOCl<sub>2</sub>, Li-BC X, Li-CFx, and secondary rechargeable batteries are Ag Zn Ni Cd, Ni H<sub>2</sub>, and Li-ion. In these battery systems, the Ag Zn battery was used in the early days of space missions such as the Russian spacecraft "Sputnik" and the US spacecraft "Ranger 3".

Will lithium-ion batteries meet NASA's energy needs?

But even when brought to their energy storage potential, lithium-ion batteries will not meet NASA's needs. Capitalizing on JCESR's research, Glenn will focus on developing next generation batteries with energy capacities beyond those of lithium-ion batteries to meet the aggressive goals of the space program.

Should space batteries be safer than terrestrial batteries?

They need to be higher performance and safer than terrestrial batteries, while still being able to operate in some very harsh environments. Research into newer battery chemistries as well as the development of safe and rugged battery assemblies for space are an important role for NASA's Glenn Research Center.

Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.
