### How does a solar inverter work?

Solar panels use sunlight as a source of energy to generate direct current (DC) electricity. Solar inverters convert this DC electricity to alternating current (AC) electricity, which is then transferred to an electrical fuse box. From there, electricity is dispersed throughout the home's electrical circuits for use.

Poor road and transport conditions. Spillage of coolant / refrigerant / dangerous substances. Contamination of environment. Injury. Regular inspection of containment/ bunding.

Can energy storage be co-located with energy generation?

Co-locating energy storage with energy generation is becoming increasingly common. Energy storage could be co-located with solar panels, wind turbines, hydroelectric generators, hydrogen production facilities or storage or different battery technologies.

### Are solar panels a fire risk?

This may cause sparking or arcing that may cause a potential fire risk. After severe weather events like strong winds and hailstorms, check for damaged or cracked panels. solar panels, creating a potential fire risk. Check the Invertor Panel as it may indicate a fault. Any repairs should be carried out by an accredited contractor.
