

High electricity prices absorb energy storage costs

Does storage reduce the cost of electricity?

In general, they conclude that storage provides only a small contribution to meet residual electricity peak load in the current and near-future energy system. This results in the statement that each new storage deployed in addition to the existing ones makes the price spread smaller, see Figure 16, and, hence, reduces its own economic benefits.

Do storage costs compete with electricity prices?

In this context, storage costs compete with the price of electricity for end consumers, and if they are less than the final electricity prices (with all fees and taxes considered but not including the fixed costs), then the costs of storage demonstrate a positive economic performance.

Do market-based storage technologies compete with electricity prices?

All market-based storage technologies have to prove their performance in the large electricity markets or if applied decentralized, the (battery) systems compete with the electricity prices at the final customers level when the battery costs are also taken into consideration.

How much does storing electricity cost?

Figure 3 depicts the overall costs of storing electricity in new plants or devices for various storage systems for the year 2018, including costs for capital, electricity, and operating and maintenance (O&M). As observed, a huge range exists for the spread of the overall costs--from about 8 cents/kWh up to close to 1 EUR/kWh.

How important are electricity storage technologies for wholesale electricity markets?

As the amount of electricity generated by variable renewable energy technologies (VARET), mainly wind and photovoltaics (PV) increases, electricity storage technologies and their relevance for the wholesale electricity markets becomes more vital.

How can we discuss future electricity storage cost?

A new approach to discuss future electricity storage cost is introduced by McPherson et al. (2018), using the integrated assessment mode MESSAGE to include the uncertainties of VARET provision and abatement cost.
