How does a cascaded H-bridge converter-based battery energy storage system protect against lightning?

The lightning transients of cascaded H-bridge converter-based battery energy storage system (CHBC-BESS) are first studied. The reactor plays a key role in protecting the CHBC-BESS by reducing both the magnitude and steepness of lightning surge. The layout of CHBC-BESS within prefabricated cabins significantly influences the lightning transients.

Does Lightning overvoltage affect a hybrid wind turbine-photovoltaic-battery energy storage system?

The lightning overvoltage in the hybrid wind turbine-photovoltaic-battery energy storage system is investigated, revealing that the surge originating from the photovoltaic system does not affect the wind farm (WF), the BESS, and the hybrid substation.

Can lightning cause a back flashover?

However, if the intensity of lightning exceeds the withstand level of OHL, it can result in a back flashover. The insulator is modeled using a controlled switch in parallel with a 1 pF capacitor. The switch closes when the  $v-t$  curve intersects with the voltage across the insulator. The results are depicted in Fig. 10. Fig. 10.

What is the maximum absorbed energy at a 35 kV busbar?

In case B, the maximum absorbed energy at the 35 kV side is 51.91 kJ. To mitigate potential damage to the arresters from high lightning currents or multiple strikes, it is recommended to use multi-column parallel surge arresters at the 35 kV busbar.

What is the clamping voltage of a thyristor switch?

In this study, the thyristor switches are rated at 2000 V, while the rated voltage of IGBT is 1700 V. Considering these factors and maintaining a 10 % insulation margin, the clamping voltage of MOV is set to 1.5 kV. The results following the installation of MOV are illustrated in Fig. 17. Fig. 17.
