

Why do data center developers need battery energy storage systems?

As a result, data center developers are working toward innovative solutions to meet the growing energy demands of their facilities while also reducing their carbon footprint. Battery Energy Storage Systems (BESS) are emerging as a critical component of modern data center infrastructure.

Why do data centers need energy storage?

Backup Power: In the event of an outage, BESS can provide backup power to keep data centers operational, minimizing downtime and data loss. As data center developers face the newer challenges of AI and the processing needs of larger applications, energy storage will play an increasing role in providing reliability and sustainability.

What is a battery energy storage system?

Battery Energy Storage Systems (BESS) are emerging as a critical component of modern data center infrastructure. By providing service to your operation's power grid, as well as secondary backup support, BESS can help improve energy reliability while reducing the reliance on fossil fuels.

Should data centres rethink battery energy storage?

Add to this the serious issue of battery waste and the toxic process of recycling them and it is clear that now is the time for data centres to take another look at their power supply, sourcing more environmentally safe, longer-term solutions. In today's world, battery energy storage has a far broader - and more crucial - role to play.

How can thermal storage help data centers?

Thermal storage can result in peak electrical demand savings and improve chilled water system reliability in data centers, which often have particularly high cooling loads. It is a method of storing thermal energy in a reservoir for later use.

How can a large-scale battery energy storage system help reduce energy costs?

By connecting larger-scale battery energy storage to on-site clean technology such as solar PV and the grid, it is possible to vastly increase access to renewably sourced energy, sell excess renewable energy to the grid and recharge when tariffs are cheaper (at night, for instance) which helps to lower emissions and costs.
