What is distributed energy storage?

Distributed energy storage refers to small-scale energy storage systems located at the end user site that increase self-consumption of variable renewable energy such as solar and wind energy. These systems can be centrally coordinated to offer different services to the grid, such as operational flexibility and peak shaving.

How does centralized storage affect electricity costs?

The impact of centralized coordination of storage resources on residential consumers' annual electricity costs generally increases with the level of variable renewable generation capacity in the electricity system while inversely related to the level of flexible supply capacity.

Can demand-side energy storage reduce electricity bills?

This paper examines the possible economic impact of owning a demand-side energy storage system on the savings to a typical domestic consumer equipped with a solar PV microgeneration system. We conclude that pairing solar PV with storage could reduce electricity bills for a typical UK consumer by 80-88%.

Does centralized coordination affect energy storage savings?

Centralized coordination of small-scale energy storage systems, such as home batteries, can offer different services to the grid, like operational flexibility and peak shaving. This paper investigates how centralized coordination versus distributed operation of residential electricity storage could impact the savings of owners.

What does Energy Storage (EES) refer to?

In this paper, the terms Energy Storage (EES), 'electricity storage', 'energy storage', and 'storage' are used interchangeably. They all refer to technologies that can store electricity and discharge it back at a reasonable response time. Examples of such technologies include secondary electro-chemical batteries, flow batteries, pumped hydropower storage (PHS), etc.

Should energy storage aggregation be a trade-off between private and system benefits?

From a modelling perspective, energy storage aggregation involves trade-offs between private and system benefits. However, it is unlikely that consumers will allow an aggregator to control their resources unless they are paid a financial incentive to do so [57].
