How much energy does a buck boost inductor handle?

A Buck-Boost inductor has to handle all the energy coming toward it -- 50 mJas per Figure 5.4, corresponding to 50 W at a switching frequency of 1 MHz. Note: To be more precise for the general case of i<=1: the power converter has to handle P IN /f if we use the conservative model in Figure 5.1, but only P O /f if we use the optimistic model.
